### Pfizer vaccine brings about long lasting Microcirculatory Activation, Associated, Type I, in Limbic System.

Posted by Stagnaro on 02 Jan 2021 at 08:26 GMT

I reported recently via email to the competent Italian health authorities and the EMA a clinical psychokinetic (1, 2) observation, worthy of being corroborated by large data from the Image Department, of course. Immediately after the inoculation of the Pfizer vaccine - currently the only one used in Italy - the microcirculation in the hippocampus and throughout the limbic system is activated in a persistent, protract, sustained way (3). In short, the administration of this vaccine causes the Microcirculatory Activation type I, associated, immediate and prolonged of the Brain Sensors (4, 5). If my clinical data will be confirmed by sophisticated methods (NMR, SPECT, a.s.o.), a careful reflection on the potential pathological significance of the activation of the Brain Sensors, which I discovered, will be necessary and urgent.
